enhancement

v1.1-candidate

Tehsmash opened on Jun 25

Contributor

Idempotency & safe retries

Problem

If a client crashes (or the connection drops) after sending the first message but before it receives and persists the server-generated `taskId / contextId`, it has no way to learn whether a task was started on its behalf — and no safe way to retry. There is no transport-level mechanism to deduplicate retried requests.

Consolidated issues

- ☐  [\[Bug\]: Idempotency hole when sending first message #928](#) — Idempotency hole when sending the first message (*anchor; v1.1-candidate, defines the problem*)
- ☐  [\[Feat\]: Proposal: Standardize Idempotency-Key Header for A2A Protocol #1893](#) — Standardize an `Idempotency-Key` header for the JSON-RPC/HTTP binding (*proposed mechanism*)

Acceptance criteria

- The spec defines an idempotency mechanism for message send (client-supplied idempotency key and/or a defined retry/replay contract).
- Server-side deduplication semantics are specified (what a server MUST do on a repeated key).
- Mechanism is expressed consistently across all three bindings.
- Security considerations are addressed (idempotency keys MUST NOT enable unauthorized cross-client interaction with a task — the original reason compound/client-set IDs were removed).

Notes

[#928](#) is the problem statement; [#1893](#) is one concrete solution (an `Idempotency-Key` header). Resolve them together so the chosen mechanism actually closes the [#928](#) hole.
